<div>Daily Challenge 22.2</div> <div>(Due: <del>Wednesday 2/20 at 12:00 noon Eastern</del>) (Due: Thursday 2/21 at 12:00 noon Eastern)</div> <p>In session 50 we introduced Jordan measure. Today you'll practice some proofs involving basic measure theory.</p> <div>(1) Problem: some Terry Tao reading.</div> <p>Read pages 2-5 of <a href="#">Terry's book here</a>, from "1.1. Prologue: the problem of measure" to Exercise 1.1.1.</p> <p>I already did the first part of Exercises 1.1.1, involving unions, for you in session 50; now you'll try some of the other parts. <a href="#">Answer on Overleaf</a>.</p> <p>(a) Do the part about translates: prove that <math>E + x = \{y + x \mid x \in E\}</math> is elementary.</p> <p>[Hints: just write out carefully what this means. You're adding some constant <math>x = (x_1, \dots, x_n)</math> to every point in <math>E</math>. But <math>E</math> was a finite union of boxes, so the translated result will be a finite union of boxes all shifted by <math>x</math>.]</p> <p>(b) Attempt the part about intersections: prove that <math>E \cap F</math> is elementary. This is harder. If you get stuck, just write up some thoughts (as usual, you must say <i>something</i> that required a non-zero amount of thought, rather than "I don't know how to start.")</p> <p>[Hints: we saw way back in chapter 1 that intersections distribute over unions: <math>A \cap (B \cup C) = (A \cap B) \cup (A \cap C)</math> So an intersection of elementary sets can be written as a union of intersections of boxes. Can you prove that an intersection of boxes is elementary? Start in one dimension: can you prove that an intersection of two intervals is an interval?]</p> <div>daily_challenge</div> <div>Updated 1 month ago by Christian Ferko</div>
